HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.
Abstract. AGORA UCS is a new architecture designed for distributed learning as a side effect of communication and collaboration. This architecture aims to achieve (i) ubiquity (time and space independent access by community members); (ii) immanence (full internal control of the destiny of the community) and (iii) multi-modal communication (reinforcing the interactions between the members of the community). The theoretical model underlying AGORA UCS is inspired by an integration of agents and Grid concepts (AGIL). AGORA UCS has been experimented by a dozen of communities, which represent altogether about seventy members. We achieved quite promising results in terms of motivation and collective performances\(^1\).

1 Requirements

Conversation and collaboration is the foundation of human learning. We base our requirements on a learning theory consisting of conversational cycles [9]. This theoretical background led us to draft the essential characteristics of a collaborative environment supporting mutual understanding and joint work: (i) immediate awareness of the life of the community; (ii) ability to maintain a clear and unambiguous internal model of the working environment and ongoing processes during the successive collaboration sessions. These general ideas have grounded the concept of AGORA UCS in order to: (i) allow secure access to services in a terminal independent way; (ii) support ubiquity yet keeping the state of the collaboration independently from the user access location; (iii) dynamically allocate resources for any use of any service within a pool of mutualized and virtualized physical resources.

2 Architecture

The integration of Agents [1,2,3,7] and Grid concepts [5,6] has been extensively modeled in [8]. Figure 1 represents the AGORA UCS architecture which is based on a ternary relation between three concepts. The VO (Virtual Organisation), a concept borrowed from Grid, is a community of agents associated with dedicated

resources (the *service container*) and *rights* which specify the level of authorisations of a VO member over a given *service*. This conceptual model allows to develop a flexible structure satisfying the self organisation requirement of the communities. In the figure, the inspiring Agent and Grid models are highlighted (AGR: Agent-Group Role [5], OGSA: Open Grid Service Architecture [6]).

### 3 Experimentations and results

The experimentations focus both on user behavior as well as system performance to compare subjective and objective results. Most users do not have any skill in computer management. The seamless access to AGORA UCS via a simple web browser as a *thin terminal*, was implied by the requirements. Once created, a VO is completely autonomous. Among others, the EnCoRe\(^2\) scenario has provided the most interesting results. AGORA UCS allowed a quick mastering of complex computational tools: unskilled users were at ease in their operations including the delegation of rights [4]. AGORA UCS enabled, for instance, the visual representation of chemistry models at a distance so that attention was put by the users on the semantics of the domain. Since, the behavior could not be foreseen in advance, the flexibility of the AGORA UCS model allowed the community to

freely organise itself. Various situations of collaboration with reinforced modal-
ities of interaction by using a synchronous communication interface has favored
the emergence of collective intelligence. Discussions in real time, combined with
visual representations on shared desktops, allowed the actors to increase the ef-
effectiveness of the collaboration process. As a conclusion, the acceptance of
the technology was extremely high and promising, even if we cannot yet certify that learning has indeed occured as a side effect of enthusiastic collaboration at a
distance.
