Submitted on 11 Dec 2007

HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

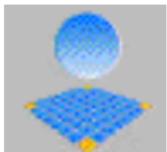

Minisatellite Markers Reveals Frequent Genetic Exchanges among House Mouse Subspecies

Eric Rivals

Outline

1. Minisatellite data

2. Methods

2.1 Protocol

2.2 Molecular Divergence Estimation - Alignment

2.3 Robustness and Confidence

3. Results

3.1 Coalescence

3.2 Intruders

4. Conclusion

Minisatellites (MS)

- **Tandem repeat** loci present in genome of all kingdom

Minisatellites (MS)

- ▶ **Tandem repeat** loci present in genome of all kingdom
- ▶ > 5% in bacteria *E. ruminatum*

Minisatellites (MS)

- ▶ **Tandem repeat** loci present in genome of all kingdom
- ▶ > 5% in bacteria *E. ruminatum*
- ▶ pattern between 7 and 100 bps, up to 20 Kb long

Minisatellites (MS)

- ▶ **Tandem repeat** loci present in genome of all kingdom
- ▶ > 5% in bacteria *E. ruminatum*
- ▶ pattern between 7 and 100 bps, up to 20 Kb long
- ▶ **Polymorphism:** Hypervariable in *H.s.*, (> 0.5% per gamete)

Minisatellites (MS)

- ▶ **Tandem repeat** loci present in genome of all kingdom
- ▶ > 5% in bacteria *E. ruminatum*
- ▶ pattern between 7 and 100 bps, up to 20 Kb long
- ▶ **Polymorphism:** Hypervariable in *H.s.*, ($> 0.5\%$ per gamete)
Simply variable in *M.m.*(add > 3 units: $< 5.10^{-6}$ per gamete)

Minisatellites (MS)

- ▶ **Tandem repeat** loci present in genome of all kingdom
- ▶ > 5% in bacteria *E. ruminatum*
- ▶ pattern between 7 and 100 bps, up to 20 Kb long
- ▶ **Polymorphism:** Hypervariable in *H.s.*, ($> 0.5\%$ per gamete)
Simply variable in *M.m.*(add > 3 units: $< 5 \cdot 10^{-6}$ per gamete)
- ▶ Mouse: simple intra-allelic tandem duplication and contraction
[Bois et al., 2002]

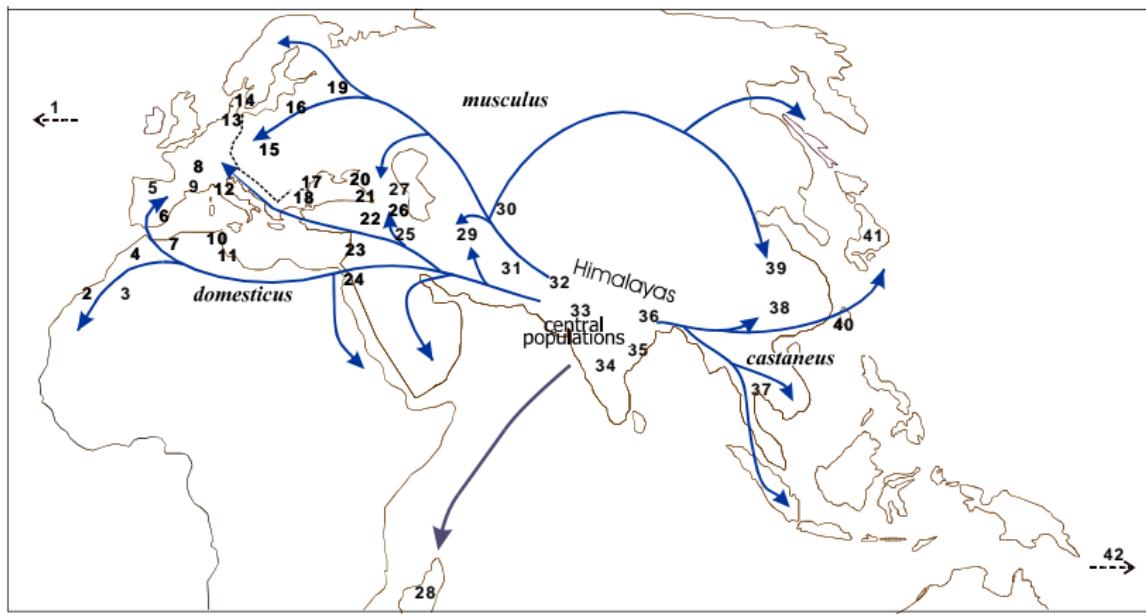

Minisatellites (MS)

- ▶ **Tandem repeat** loci present in genome of all kingdom
- ▶ > 5% in bacteria *E. ruminatum*
- ▶ pattern between 7 and 100 bps, up to 20 Kb long
- ▶ **Polymorphism:** Hypervariable in *H.s.*, ($> 0.5\%$ per gamete)
Simply variable in *M.m.*(add > 3 units: $< 5 \cdot 10^{-6}$ per gamete)
- ▶ Mouse: simple intra-allelic tandem duplication and contraction
[Bois et al., 2002]
- ▶ MS informative for intra-species evolution

Minisatellite data

- ▶ Four minisatellite loci: MMS 24, 26, 80, and 30 respectively on chromosomes 7 (22 cM), 9 (68 cM and 79 cM), and X (43 cM)
- ▶ Panel of 116 individuals of various geographical origins
- ▶ Maps obtained by MVR-PCR as in [Bois et al., 2002]
- ▶ High diversity in length and array structure
haplotypic diversity (H_e) in [0.90, 0.99]

Geographical origin of wild mice

Mouse minisatellite maps of MMS30 (X chr)

Repeat unit: 39 bps

Variant code sequence

- ▶ Insertion (dual): WY → WGY
- ▶ Tandem duplication: WKY → WKKY
- ▶ Tandem contraction (dual): WKKY → WKY

⇒ variation in their number of units

Example of an alignment of 2 maps

An alignment produced by *MS_Align* between maps *cccccccdddbaa* and *ccdddddubbacccbaa* with the costs

$A = C = 1$, $I = D = 40$, $\mathcal{M}(a, b) = \mathcal{M}(a, d) = \mathcal{M}(b, d) = 20$, $\mathcal{M}(a, c) = \mathcal{M}(b, c) = \mathcal{M}(c, d) = 10$. Its cost is $14 \times A + \mathcal{M}(b, c) + \mathcal{M}(c, a) = 34$. Plain lines: matches, dashed lines: amplifications and contractions, bold lines: mutations.

Percentage of explained variance (VAF)

$$\text{VAF} = 1 - \frac{\sum_{(i,j):i < j} (D(i,j) - T(i,j))^2}{\sum_{(i,j):i < j} (D(i,j) - D_m)^2}$$

where

$D(i,j)$: alignment distance between i and j

$T(i,j)$: tree distance between i and j

D_m : average alignment distance over all pairs (i,j)

Value in $[0, 1]$

Rate of elementary well designed quartets (Re)

For an internal edge e , for all quartets (i, j, k, l)
s.t. e splits (i, j) and (k, l) :

$R(e) = \text{percentage of these quartets satisfying}$

$$(D(i, j) + D(k, l)) < \min(D(i, l) - D(j, k), (D(i, k) - D(j, l)))$$

where

$D(i, j)$: alignment distance between i and j

Value in $[0, 1]$

Results

Identical alleles

Conclusion

Conclusion

- ▶ MS analysis revealed:
 1. species-wide genetic flow
 2. past and present exchanges within the species range

Conclusion

- ▶ MS analysis revealed:
 1. species-wide genetic flow
 2. past and present exchanges within the species range
- ▶ when handled with appropriate comparison algorithms
[Bérard, Rivals, 2003]

Conclusion

- ▶ MS analysis revealed:
 1. species-wide genetic flow
 2. past and present exchanges within the species range
- ▶ when handled with appropriate comparison algorithms
[Bérard, Rivals, 2003]
- ▶ MS versus SNPs

Conclusion

- ▶ MS analysis revealed:
 1. species-wide genetic flow
 2. past and present exchanges within the species range
- ▶ when handled with appropriate comparison algorithms
[Bérard, Rivals, 2003]
- ▶ MS versus SNPs and micro-satellites

Conclusion

- ▶ MS analysis revealed:
 1. species-wide genetic flow
 2. past and present exchanges within the species range
- ▶ when handled with appropriate comparison algorithms
[Bérard, Rivals, 2003]
- ▶ MS versus **SNPs** and **micro-satellites**
- ▶ Mice genomes: set of interrelated gene pools, still able to exchange genes, **even on chromosome X**
- ▶ Difficult to find genes important for speciation
