Formal and Relational Concept Analysis approaches in Software Engineering: an overview and an application to learn model transformation patterns in examples

Xavier Dolques, Marianne Huchard, Clémentine Nebut, Hajer Saada

1 INRIA, Centre Inria Rennes - Bretagne Atlantique
2 LIRMM - Université Montpellier 2, CNRS

First ICESE Virtual Workshop on Software Engineering and Artificial Intelligence, may 2011
1 Introduction

2 FCA

3 RCA

4 “Model Transformation By example” approaches

5 Illustrative Example

6 Models Matching

7 Transformation patterns/rules generation

8 Conclusion
Motivations

Software contains plenty of data analysis problems involved in
- the forward engineering process
- the re-engineering tasks
- various analyses

Focusing on Formal Concept Analysis
- an exploratory data analysis / data mining method
- an unsupervised machine learning approach
- produces clusters, classification and implication rules
Motivations

Highlight main characteristics of FCA
- defining FCA
- main applications of FCA in SE
- multi-relational data analysis with RCA
- young applications of RCA in SE

Learning model transformation (MT) patterns
- on examples of MT
- building of MT examples using ontology alignment
- learning MT patterns with RCA
Outline

1 Introduction
2 FCA
3 RCA
4 “Model Transformation By example” approaches
5 Illustrative Example
6 Models Matching
7 Transformation patterns/rules generation
8 Conclusion
What is FCA?

- a formalization of the philosophical notion of concept
- an approach for data analysis and knowledge processing
- many existing experiences and projects
- algorithms, graphical representations, tools
- an active research community (3 conf. ICFCA, CLA, ICCS)

source http://people.aifb.kit.edu/jvo/fca4sw/
What is a concept?

The concept *bird*

- a set of objects (concept’s extent):
  ![Birds](image)
- a set of attributes / characteristics (concept’s intent):
  - feathers, with a bill, etc.
Formal Concept Analysis (FCA)

How concepts are organized?

The concept *flamingo* is a subconcept of the concept *bird*

- inclusion of concept’s extents:
  the set of flamingos is included in the set of birds

- inclusion of the concept’s intents:
  the attributes of birds are included in the attributes of flamingos
The formal context

Things that are known about the world

<table>
<thead>
<tr>
<th></th>
<th>flying (fl)</th>
<th>nocturnal (n)</th>
<th>feathered (fe)</th>
<th>migratory (m)</th>
<th>duck-billed (db)</th>
<th>web (w)</th>

Concepts can be derived from a formal context

A formal concept is a pair \((X, Y)\) where
- \(Y\) is the set of attributes common to the objects of \(X\)
- \(X\) is the set of objects having all attributes of \(Y\)

FCA in Software engineering

A Survey of Formal Concept Analysis Support for Software Engineering Activities, Tilley et al., FCA 2005

... And many research work during the past 5 years

- Requirement Analysis: elaborating requirements [Andelfinger], reconciling stake-holders [Düwel et al.], linking use cases and classes [Böttger et al.]
- Component / Web service classification and retrieval [Lindig, Fisher, Aboud et al., Azmeh et al.]
- Exploring a formal specification [Tilley]
- Dynamic analysis: debug temporal specifications [Ammons et al.], test coverage [Ball], locating features [Eisenbarth et al., Bojic et al.], fault localization [Cellier et al.]
Analysis of legacy systems:

- Configuration structure [Snelting]
- Grouping fields in COBOL systems [Van Deursen et al., Kuipers et al.]
- Migrating COBOL towards Corba components [Canfora]
- Migrating from imperative to OO paradigm [Sahraoui et al., Siff et al., Tonella]
- Reengineering class hierarchies [Snelting et al., Schupp et al., Godin et al., Huchard et al.]
- Detecting patterns [Tonella and Antoniol, Arévalo et al.]
- Order for reading classes [Dekel]
- Bad smell correction [Bhatti et al.]
- Conceptual code exploration [Cole et al.]
- Aspect mining [Tonella and Ceccato, Tourwé and Mens]
- Access-guided client class extraction for Eiffel [Ardourel and Huchard]
- Mining Source Code for Structural Regularities [Lozano et al.]
Extend the purpose of FCA for taking into account relations between objects

The RCA process relies on the following main points:

- a relational model based on the entity-relationship model
- a conceptual scaling process allowing to represent relations between objects as relational attributes
- an iterative process for designing a concept lattice where concept intents include non-relational and relational attributes.

RCA provides relational structures that can be represented as ontology concepts within a knowledge representation formalism such as description logics (DLs).

A relational model based on the entity-relationship model ...

A RCF $\mathcal{F}$ is a pair $(K, R)$ with:
- $K$ is a set of formal contexts $K_i = (O_i, A_i, I_i)$
- $R$ is a set of relational contexts $R_j = (O_k, O_l, I_j)$,

Pizza RCF

$K = K_{\text{People}}, K_{\text{Pizza}}, K_{\text{Food}}, K_{\text{Country}}$
$R = R_{\text{eats}}, R_{\text{contains}}, R_{\text{producedIn}}, R_{\text{hasForNational}}$
An iterative approach (RCA)

Learned concepts are used in a next step to learn more
RCA - Step 0 - Initial Lattices
Scaling relations

Integrating concepts in the relational contexts

Amedeo eats Margherita ; Margherita ∈ extent(Concept_11)
→ ∃p ∈ Concept_11, s.t. Amedeo eats p
→ (Amedeo, eats:Concept_11)
→ (Amedeo, Concept_11) belongs to the existentially scaled relation eat*, (Amedeo, ∃ eat :Concept_11) stands

Applications

- **UML class diagram refactoring**

- **UML Use case diagram refactoring**
  * X. Dolques, M. Huchard, C. Nebut, and P. Reitz. Fixing generalization defects in UML use case diagrams. CLA 2010: 247-258

- **Blob design defect correction**

- **Extracting architectures in object-oriented software**
Applications

- **Learning model Transformation patterns in MDE**

- **Classification of web services**

- **Ontology construction**

- **Ontology pattern extraction**

- **Ontology restructuring**
A synthesis on RCA

- an iterative method to produce abstractions
- variations on scaling operators: $\exists, \forall, \forall\exists, \geq n r : c$, etc. (on relational contexts and on steps)
- object-attribute concept posets can be built instead of lattices to limit the complexity
- opportunities for enhancing application of FCA to software engineering domain

Tools

- Galicia: http://galicia.sourceforge.net/
- eRCA: http://code.google.com/p/erca/
Context and Motivations

Context

- Model driven development
- Development of a model transformation
- source and target metamodels require domain experts

Motivations

- Ease and speed up the development process of model transformations
- Improve the integration of domain expert in the process

“By Example” approaches

[Balogh et Varró(2009)]

- **Input matching**: set of typed couples of elements
- **Matching creation**: manually
- **Input specific development**: none
- **Learning principle**: Inductive Logic Programming
- **Output data**: transformation rules (VIATRA)
“By Example” approaches

[Wimmer et al.(2007)]

- **Input matching**: set of couples of elements
- **Matching creation**: manually
- **Input specific development**: explicit constraints of the transformation from concrete to abstract syntax
- **Learning principle**: *ad hoc* method
- **Output data**: ATL code
“By Example” approaches

[Kessentini et al. (2008)]

- **Input matching**: set of block couples
- **Matching creation**: manually
- **Input specific development**: none
- **Learning principle**: metaheuristics
- **Output data**: a transformed model
“By Example” approaches

Our approach

- **Input matching**: set of couples of elements
- **Matching creation**: matching assisted by tool
- **Input specific development**: none
- **Learning principle**: Relational Concept Analysis
- **Output data**: specification of transformation rules ordered in a lattice

Models Matching

Icons: http://www.openclipart.org (Public Domain)
Hypotheses

- the informal starting example contains named elements: those elements are to be found in the two models
- source and target models structure are close enough
State of the Art

Constraints of the matching methods that can be applied
- can be applied on a graph structure (not only a tree)
- not strictly based on semantic analysis

Relevant matching approaches
- Similarity Flooding [Melnik et al., 2002]
- OLA [Euzenat et al., 2004]
- **Anchor Prompt** [Noy et Musen, 2001]

Advantage of anchorPrompt
- does not use similarity on relations names (relations names come from the metamodel level)
Description of process

Matching using Attributes values
- enumeration of values in the models
- matching of similar values
- matching of the elements containing those values

Matching Propagation
- using structure similarity assumption

By Example
Example
Matching
Transformation
Generation
Conclusion
To address the model matching problem

- Starting with 2 assumptions
  - the starting example contains named element
  - the models to match are structurally close
- We propose a process generating a model matching
  - using attributes values for a first matching with high confidence level
  - using an adaptation of AnchorPROMPT for extending the first matching

Consider the properties of the model elements:
- their class
- their relations with their neighbors
- the properties of their neighbors

Classify the different properties from the examples
Classify the matching links considering the classification of the properties of their extremities

Formal Concept Analysis allows the classification of a set of objects considering their attributes
Transformation of models in tables

- Metamodel elements contexts
  - Source metamodel context
  - Target metamodel context
- Model elements contexts
  - Source model context
  - Target model context
- Matching links context
- Relations
  - between model source elements and their class from the source metamodel
  - between model target elements and their class from the target metamodel
  - between model source elements: *e.g.* `ownedAttribute`
  - between model target elements: *e.g.* `attribute`
  - between matching links and their source from the source model
  - between matching links and their target from the target model

The management of relations requires RCA to iterate

### Data Analysis

- **min**, **max**, **avg.**, and **std. dev.** columns provide statistical summaries of the data for each column.
- The table includes a variety of rule names and their respective sizes, number of extracted rules, and statistical measures for premise size and premise depth.

### Conclusion

- The data analysis suggests varied performance across different rule names, with some rules showing significant size and depth variations.

**Introduction FCA RCA By Example Example Matching Transformation Generation Conclusion**
The generation of transformation patterns is the result of the following steps:

- the transformation of the examples into relational contexts
- the application of the process RCA
- the interpretation of the final lattices
Introduction
FCA
RCA
“Model Transformation By example” approaches
Illustrative Example
Models Matching
Transformation patterns/rules generation
Conclusion
An approach with tool for assisting the development of model transformations
Contribution

- Implementation independent with transformation metamodels
- Model matching assisted
- Result usable thanks to lattices
- Result genericity
Perspectives

Model matching
- Improving precision on the AnchorPROMPT adaptation
- Adapt other matching approaches for model matching

Transformation rules generation
- Building relations in final model for not simple case
- Improving interaction with user
- Insisting on approach validation

Evolutions
- Adapt the approach to other problems
- Investigating complementarity with other approaches
