HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.
ABSTRACT
Within the framework of the European project EcoBioCap, we model a real world use case aiming at conceiving the next generation of food packagings. The objective is to select packaging materials according to possibly conflicting requirements expressed by the involved parties (food and packaging industries, health authorities, consumers, waste management authority, etc.). The requirements and user preferences are modeled by several ontological rules provided by the stakeholders expressing their viewpoints and expertise. Since several aspects need to be considered (CO2 and O2 permeance, interaction with the product, sanitary, cost, end of life, etc.) in order to select objects, an argumentation process can be used to express/reason about different aspects or criteria describing the packagings. We define then in this paper an argumentation approach which combines a description logic (DLR-Lite) within ASPIC framework for relational database querying. The argumentation step is finally used to express and/or enrich a bipolar query employed for packaging selection.

2. CONTRIBUTIONS
The main contributions of the paper are the following:

1. A DLR-Lite [7, 5] ontology extended to a negation to express stakeholders’ arguments about packaging characteristics as combination of facts and inference rules (specified as subsumptions). The language is detailed in the technical report [12].

2. An instantiation of ASPIC argumentation system AS with the proposed DLR-Lite logical language. The instantiated ASPIC AS satisfies the rationality postulates [6], please see details in [12],

3. The study of the influence of the modeling rules on the argumentation results. We showed the limitation of the crisp split of the inference rules into defeasible and strict, and we propose to overcome this limitation a viewpoint approach in which arguments are gathered according to packaging aspects. Each viewpoint delivers subsets of non-conflicting arguments supporting or...
We have proposed an argumentation system in which each criterion is considered as a viewpoint in which stakeholders express their arguments in homogenous way. The set of non conflicting viewpoints are then gathered according to goals, to form consistent collections which support/ Oppose them.

We plan to extend the proposed approach to fuzzy argumentation to make it possible to deal with vague and uncertain concepts and rules by exploiting the fuzzy interpretation of the fuzzy DLR-Lite. Another line to develop consists of studying the bipolarity in our context of argumentation.

4. ACKNOWLEDGEMENTS

The research leading to these results has received funding from the European Community’s seventh Framework Program (FP7/ 2007-2013) under the grant agreement n°FP7- 265669-EcoBioCAP project. The authors would like to thank Pr. Leila Amgoud (IRIT Toulouse, CNRS) for her valuable comments and feedback.

opposing a kind of packaging according to a single aspect (respiration parameters, cost, materials, sanitary, end of life, etc.).

4. The use of the argumentation results for a bipolar querying of the packaging database. Indeed, we can gather the results onto positive and negative collections. We can then deduce automatically such queries from the collections the users formed during the argumentation process. We can also carry out an analogical reasoning by generalizing results obtained from an argumentation process applied upon instances, where an instance of the sought objects can help to better understand the involved stakeholders’ needs and then to be able to express, based on arguments pros and cons, a query reflecting the way objects should be selected from a database.

5. Implementation of the approach within the EcoBioCap project (www.ecobiocap.eu). A java GXT/GWT web interface was developed and a open version is accessible on p.grignon.inra.fr/EcoBioCapProduction/. The main difficulties encountered were the translation of text arguments into DLR-Lite formal representation. In the freely available version, stakeholders’ arguments are provided as a manually built XML file specifying viewpoints and rules. The system generates then arguments and attacks and computes the extensions (stable, preferred, admissible, grounded, naive, etc. semantics) inside each view. Figure 1 shows the main interface of the application and a fragment of rules formalizing an argumentation scenario about the aspect end of life of packagings. Stakeholders argued about biodegradability, recyclability and compostability (the test XML file is accessible on https://docs.google.com/file/d/0B0DPgJDRNwbLR2RjYWWhMjgwVEU/edit?usp=sharing).
