HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.
DALEK: A Tool for Dialectical Explanations in Inconsistent Knowledge Bases

Abstract. In this paper we present a prototype of a framework called DALEK (DaAlectical Eplanation in KNowledge-bases). This framework implements dialectical approaches to explain query answers in inconsistent knowledge bases. The motivation behind the prototype is as follows: given an inconsistent knowledge base represented within Datalog±, a semantics for handling inconsistency and a query Q, the goal is to explain why Q is accepted or not accepted under such semantics. The explanation takes a dialogical form (cf. [1,3]).

Keywords. Applications of Argumentation, Explanation and Argumentation Dialogues, Datalog±.

1. DALEK Framework: Explain!

DALEK engages a User and the Reasoner in a dialogue about the entailment of any boolean conjunctive query in Datalog± knowledge bases. The dialogue could be of argumentative or explanatory nature. In DALEK the User can shift between dialogue types (i.e. dialectical shifts). The framework is general enough to carry out a standalone argumentation dialogue as well as a standalone explanatory dialogue. DALEK also implements commitments and understanding stores.1

When the User interacts with the GUI, the latter communicates with the dialogue manager which possesses the configuration structure and the stores. Then, the dialogue manager, at its turn, communicates with the semantics structure through the sub-module “Syntax and semantics handler” and with the dialogue planner through the sub-module “Utterance dispatcher”. Next, the dialogue planner and the semantics structure communicate directly with the logical model that uses the Datalog± GRAAL library [2] to query the knowledge base. Hereafter we detail each module of Figure 1.

Configuration structure. This module specifies: (1) the set of allowed locutions with their legal replies, (2) the parameters of the protocol, e.g. unique-move, multiple-move, the participants, etc. and (3) the parameters of the planner.

Dialogue manager. This is the referee between the User and the Reasoner (i.e. dialogue planner), it dispatches their utterances through the sub-module “Utter-

The dalek’s architecture. Each layer is composed of modules and each module is composed of sub-modules.

Semantics structure. This structure implements an operational semantics of the dialogue. It associates with each reply a procedure that should be called by the dialogue manager to check the legality of the reply.

Dialogue planner. This module receives the utterances from the User through the dialogue manager and plans the next utterance. The planner in its current state tries to answer User’s utterances as they come.
