## Introduction

In this report, we give the complete proof of the theorem 1 of the paper [1]. This theorem states that the method described in the paper meets 4 requirements. The proof is given for each of these requirements.

## Requirement 1 (Optimally using the segment length)

Let us define the nodes  $v_1$  and  $v_{|V|}$  such that  $v_1 = \sigma^{-1}(1)$  and  $v_{|V|} = \sigma^{-1}(|V|)$ .

$$f(v_1) = p'(v_1) - \frac{s(v_1)}{2} + \sum_{i=1}^{\sigma(v_1)} s(\sigma^{-1}(i)) \quad (1)$$

$$= 0 - \frac{s(v_1)}{2} + s(v_1) \quad (2)$$

$$= \frac{s(v_1)}{2} \quad (3)$$

$$f(v_{|V|}) = p'(v_{|V|}) - \frac{s(v_{|V|})}{2} + \sum_{i=1}^{\sigma(v_{|V|})} s(\sigma^{-1}(i)) \quad (4)$$

$$= l - \sum_{v \in V} s(v) - \frac{s(v_{|V|})}{2} + \sum_{v \in V} s(v) \quad (5)$$

$$= l - \frac{s(v_{|V|})}{2} \quad (6)$$

We therefore obtain the required values for the first and last node positions.

□

## Requirement 2 (No overlapping)

We first develop the definition of  $f(v)$  as follows, given that  $(u, v) \in V^2$  and  $\sigma(u) < \sigma(v)$ :

$$f(v) = p'(v) - \frac{s(v)}{2} + \sum_{i=1}^{\sigma(v)} s(\sigma^{-1}(i)) \quad (7)$$

$$= p'(u) + p'(v) - p'(u) - \frac{s(v)}{2} + \sum_{i=1}^{\sigma(v)} s(\sigma^{-1}(i)) \quad (8)$$

We isolate from  $\sum_{i=1}^{\sigma(v)} s(\sigma^{-1}(i))$  the nodes ordered until  $u$  through the  $\sigma$  ordering function:

$$\begin{aligned} f(v) &= p'(u) + p'(v) - p'(u) - \frac{s(v)}{2} \\ &\quad + \sum_{i=1}^{\sigma(u)} s(\sigma^{-1}(i)) + \sum_{i=\sigma(u)+1}^{\sigma(v)} s(\sigma^{-1}(i)) \end{aligned} \quad (9)$$

By adding  $\frac{s(u)}{2} - \frac{s(u)}{2}$  to the right term of the equation, we identify the definition of  $f(u)$  and rewrite  $f(v)$  w.r.t.  $f(u)$ :

$$\begin{aligned} f(v) &= \left( p'(u) - \frac{s(u)}{2} + \sum_{i=1}^{\sigma(u)} s(\sigma^{-1}(i)) \right) \\ &\quad + p'(v) - p'(u) - \frac{s(v)}{2} + \sum_{i=\sigma(u)+1}^{\sigma(v)} s(\sigma^{-1}(i)) + \frac{s(u)}{2} \end{aligned} \quad (10)$$

$$= f(u) + p'(v) - p'(u) - \frac{s(v)}{2} + \sum_{i=\sigma(u)+1}^{\sigma(v)} s(\sigma^{-1}(i)) + \frac{s(u)}{2} \quad (11)$$

We extract from  $\sum_{i=\sigma(u)+1}^{\sigma(v)} s(\sigma^{-1}(i))$  the size of  $v$ , thus obtaining an expression of  $f(v)$  as a sum of positive terms, provided that  $p'(v) - p'(u)$  is known to be positive.

$$f(v) = f(u) + p'(v) - p'(u) + \frac{s(v)}{2} + \sum_{i=\sigma(u)+1}^{\sigma(v)-1} s(\sigma^{-1}(i)) + \frac{s(u)}{2} \quad (12)$$

which is equivalent to:

$$f(v) - f(u) = p'(v) - p'(u) + \frac{s(v)}{2} + \sum_{i=\sigma(u)+1}^{\sigma(v)-1} s(\sigma^{-1}(i)) + \frac{s(u)}{2} \quad (13)$$

For two nodes  $(u, v) \in V^2$  such that  $\sigma(u) < \sigma(v)$ ,  $p'(v) - p'(u) \geq 0$ . Moreover, the sum of node sizes  $\sum_{i=1}^{\sigma(v)} s(\sigma^{-1}(i))$  is positive. As a result:

$$f(v) - f(u) \geq \frac{s(u)}{2} + \frac{s(v)}{2} \quad (14)$$

and by extension:

$$\forall (u, v) \in V^2, |f(v) - f(u)| \geq s(u)/2 + s(v)/2. \quad (15)$$

□

### Requirement 3 (Preserving initial ordering)

From the proof of Requirement 2, we know that for two nodes  $(u, v) \in V^2$  such that  $\sigma(u) < \sigma(v)$ ,  $f(v) - f(u) \geq s(u)/2 + s(v)/2$ . Since  $s(u)/2 + s(v)/2$  is strictly positive, so is  $f(v) - f(u)$ . Hence,  $\forall (u, v) \in V^2, \sigma(u) < \sigma(v) \Rightarrow f(u) < f(v)$ . □

### Requirement 4 (Preserving relative distances)

**Lemma 1.** *The distance between two consecutive nodes  $u$  and  $v$  in the final layout is equal to the difference  $p'(v) - p'(u)$ . More formally, given two nodes  $(u, v) \in V^2$ ,*

$$\sigma(u) + 1 = \sigma(v) \Rightarrow f(v) - \frac{s(v)}{2} - (f(u) + \frac{s(u)}{2}) = p'(v) - p'(u)$$

*Proof.* Let us denote  $D$  as  $f(v) - \frac{s(v)}{2} - (f(u) + \frac{s(u)}{2})$ . We further develop  $D$  by applying the definition of  $f(v)$ :

$$D = p'(v) - \frac{s(v)}{2} + \sum_{i=1}^{\sigma(v)} s(\sigma^{-1}(i)) - \frac{s(v)}{2} - (f(u) + \frac{s(u)}{2}) \quad (16)$$

$$= p'(v) - s(v) + \sum_{i=1}^{\sigma(v)} s(\sigma^{-1}(i)) - (f(u) + \frac{s(u)}{2}) \quad (17)$$

Then by applying the definition of  $f(u) = p'(u) - \frac{s(u)}{2} + \sum_{i=1}^{\sigma(u)} s(\sigma^{-1}(i))$ :

$$D = p'(v) - s(v) + \sum_{i=1}^{\sigma(v)} s(\sigma^{-1}(i)) - p'(u) - \sum_{i=1}^{\sigma(u)} s(\sigma^{-1}(i)) \quad (18)$$

As  $\sigma(v) = \sigma(u) + 1$ ,  $\sum_{i=1}^{\sigma(v)} s(\sigma^{-1}(i)) - \sum_{i=1}^{\sigma(u)} s(\sigma^{-1}(i)) = s(v)$ , the previous equation can be simplified to prove Lemma 1:

$$f(v) - \frac{s(v)}{2} - (f(u) + \frac{s(u)}{2}) = p'(v) - s(v) - p'(u) + s(v) \quad (19)$$

$$= p'(v) - p'(u) \quad (20)$$

By applying Lemma 1, we need to prove that:

$$p(v) - p(u) \geq p(v') - p(u') \Rightarrow p'(v) - p'(u) \geq p'(v') - p'(u')$$

We first develop  $p'(v) - p'(u)$  by applying the definition of  $p$ :

$$p'(v) - p'(u) = \frac{p(v) - p_{min}}{p_{max} - p_{min}} \times C - \frac{p(u) - p_{min}}{p_{max} - p_{min}} \times C \quad (21)$$

where  $C = (l - \sum_{x \in V} s(x))$ , and  $C \geq 0$ . Then:

$$p'(v) - p'(u) = C \left( \frac{p(v) - p(u)}{p_{max} - p_{min}} \right) \quad (22)$$

$$= \frac{C}{p_{max} - p_{min}} \times (p(v) - p(u)) \quad (23)$$

Since  $C' = \frac{C}{p_{max} - p_{min}}$  is positive, we obtain that:

$$\begin{aligned} p(v) - p(u) \geq p(v') - p(u') &\Rightarrow C' (p(v) - p(u)) \geq C' (p(v') - p(u')) \\ p(v) - p(u) \geq p(v') - p(u') &\Rightarrow p'(v) - p'(u) \geq p'(v') - p'(u') \end{aligned}$$

□
